Other Site Characteristics

Il sito è costituito dal versante est della dirupata dorsale centrale del M. Baldo; esso è interessato in basso dalla faggeta che in alto sfuma nella mugheta e quindi nelle praterie alpine in ambiente di cresta, il tutto frammisto da limitati ma rappresentativi ambienti rupestri.

4.2 Quality and importance

Area notissima fin dal 1500 per l'eccezionale concentrazione di specie endemiche. Dal punto di vista vegetazionale significativa l'area di contatto tra mugheta e faggeta. Naturalità dell'area elevata. Il sito è di rilevante interesse nazionale e/o provinciale per la presenza e la riproduzione di specie animali in via di estinzione, importanti relitti glaciali, esclusive e/o tipiche delle Alpi. Presenza di specie forestali di invertebrati comprese nell'allegato II.
