### Other Site Characteristics

Dolce vallata collocata tra il gruppo del Catinaccio ed il Sasso Piatto. Il substrato è assai vario (basalti e dolomia). Il fondovalle è occupato da ampie praterie solcate dal corso del torrente Duron, lungo il quale si trovano saliceti e piccole torbiere. I versanti, solo in basso con boschi di conifere con cembro, sono coperti da pingui praterie sulla parte basaltica e da vegetazione erboso-rupestre nella parte dolomitica. Sono presenti habitat di particolare interesse non compresi nell'all.I della direttiva 92/43/CEE: Caricetalia fuscae (3%), Caricetalia curvulae (3%).

### 4.2 Quality and importance

Oltre alla ricchezza floristica e vegetazionale legata alla variabilità del substrato, è da sottolineare l'interesse delle aree umide, che rappresentano la continuazione verso sud del complesso di torbiere, di eccezionale interesse, dell'Alpe di Siusi (BZ). Il sito è di rilevante interesse nazionale e/o provinciale per la presenza e la riproduzione di specie animali in via di estinzione, importanti relitti glaciali, esclusive e/o tipiche delle Alpi.
