- **Group:** A = Amphibians, B = Birds, F = Fish, I = Invertebrates, M = Mammals, P = Plants, R = Reptiles
- **S:** in case that the data on species are sensitive and therefore have to be blocked for any public access enter: yes
- **NP:** in case that a species is no longer present in the site enter: x (optional)
- **Type:** p = permanent, r = reproducing, c = concentration, w = wintering (for plant and non-migratory species use permanent)
- **Unit:** i = individuals, p = pairs or other units according to the Standard list of population units and codes in accordance with Article 12 and 17 reporting (see [reference portal](#))
- **Abundance categories (Cat.):** C = common, R = rare, V = very rare, P = present - to fill if data are deficient (DD) or in addition to population size information
- **Data quality:** G = 'Good' (e.g. based on surveys); M = 'Moderate' (e.g. based on partial data with some extrapolation); P = 'Poor' (e.g. rough estimation); VP = 'Very poor' (use this category only, if not even a rough estimation of the population size can be made, in this case the fields for population size can remain empty, but the field "Abundance categories" has to be filled in)

3.3 Other important species of flora and fauna (optional)

Other Site Characteristics

Include il massiccio granitico dell'Adamello-Presanella, situato nel settore occidentale del Parco Adamello-Brenta. Il profondo solco vallivo a modellamento glaciale percorso dal Sarca di Genova, definisce e separa i due sottogruppi cristallini della Presanella a Nord e dell'Adamello a Sud, inoltrandosi in direzione ovest tra strette pareti e ripidi versanti coperti da fitti boschi di latifoglie e conifere. Un elemento di spicco nel paesaggio della Val Genova, una delle più tipiche e celebri valli alpine di origine glaciale, è costituito dalla ricchezza di acque e dall'alto grado di naturalità ambientale. Numerose sono le valli laterali, tutte sospese rispetto alla principale, per cui i relativi corsi d'acqua danno luogo a cascate ricche di acqua e di eccezionale bellezza.

4.2 Quality and importance

I versanti sono ricoperti da vaste foreste di conifere (abete rosso e larice, con nuclei di pino cembro) e di latifoglie (faggio), interrotte da radure prative; sul fondovalle e nei ripiani dei circhi glaciali sono frequenti torbiere e laghetti. Oltre il limite del bosco sono diffusi ovunque i pascoli alpini. Sono presenti habitat di particolare interesse compresi nell'all. I della direttiva 92/43/CEE, in particolare: Calamagrostio villosae - Abietetum e Galio odorati ? Abietetum. Il sito è di rilevante interesse nazionale e/o provinciale per la presenza e la riproduzione di specie animali in via di estinzione, importanti relitti glaciali, esclusive e/o tipiche delle Alpi. Frequenti nei boschi e nelle radure gli incontri con la fauna alpina rappresentata in particolare dal Camoscio, la Marmotta, il Capriolo, la Pernice bianca, il Gallo forcello ed il Gallo cedrone. Oltre ai tetraonidi, di rilievo la presenza dell'aquila reale, di rapaci notturni come civetta nana e civetta caporosso, nonché di picidi quali picchio nero e cenerino. Sono presenti specie di invertebrati dell'Allegato 2 legate a boschi in buone condizioni di naturalità.

5. SITE PROTECTION STATUS (optional)
