Other Site Characteristics

Ripido versante del settore nord-occidentale delle Dolomiti di Brenta, solcato da profondi valloni e interrotto da pareti rocciose strapiombanti. La vegetazione è formata da boschi di faggio, abete rosso, abete bianco e larice e da un piccolo nucleo di pino cembro, alla testata della Val Cavai. Sopra il limite del bosco sono estesi i pascoli alpini. Sono presenti habitat di particolare interesse non compresi nell'all.I della direttiva 92/43/CEE, in particolare: Adenostylo glabrae - Abietetum.

4.2 Quality and importance

Esempio di montagne calcaree con flora alpina ricca di specie rare ed endemiche sulle creste ed estese foreste che ricoprono con continuità i versanti. Il sito è di rilevante interesse nazionale e/o provinciale per la presenza e la riproduzione di specie animali in via di estinzione, importanti relitti glaciali, esclusive e/o tipiche delle Alpi.
